

The *point well* is the simplest, most inexpensive type of well to install.

Unlike gravel and artesian wells, which we install using very large, heavy drilling rigs, point wells can be installed using light, portable equipment we hand-carry onto your property. The use of this portable equipment enables us to install wells where larger equipment simply can't go and eliminates other added costs associated with the use of large drilling rigs. Point wells are usually 1-1/4" to 2" in diameter, less than 40' deep and are fitted with either a simple pitcher pump or electric-powered surface-mounted jet pump.

Before installing a point well, we'll first test your property with test holes. Each test hole location includes...

- Mobilization and Set up of all necessary Equipment
- Installation and driving of *Galvanized Pipe, Couplings* and *Well Point* (including stainless steel screen) up to 40' deep
- Test proposed well location(s), re-setting *casing* and *well screen* as needed.
- *Develop* proposed well with temporary pumping system.

If a test hole is successful, your very own point well, complete with pump system will be installed...

The installation of a Goulds' professional grade shallow well jet pump system including pump, pressure tank, check valve, pressure switch, pressure gauge, hose spigot, 110v or 220v electrical plug, quick winterizing disconnects and other misc. brass fittings.

If Test hole(s) are unsuccessful, equipment and materials are removed.
